

[0:00 – 0:28] Act 1: Login & The Autonomous Shift	Stage 1: Goal Context
■■ ON-SCREEN ACTIONS (MOUSE & CLICKS) Start on Login Page. Type admin@company.com and password. Click Sign in to PeoplePulse. Dashboard loads. ■ SPOKEN NARRATION (WORD-FOR-WORD) "Greetings, dear judges. Let me introduce PeoplePulse, an autonomous enterprise HR intelligence platform built for Tech Zephyr 4.0 at IIT Bhubaneswar. In modern engineering and enterprise teams, 76% of employees experience burnout before leadership realizes there's a problem. Traditional annual surveys fail because of survey fatigue and 6-month time lags. PeoplePulse transforms passive employee engagement into 60-second confidential daily micro-pulses, backed by PulseAgent: an autonomous ReAct AI agent that continuously diagnoses team friction, isolates burnout bottlenecks, and executes organizational interventions directly in your browser."	
[0:28 – 0:58] Act 2: Architecture & Why Agentic AI	Stage 2: Decision Framework
■■ ON-SCREEN ACTIONS (MOUSE & CLICKS) Hover cursor over top KPI cards: Organization Members (12/100), Active Teams (4/10), Daily Participation (83% live), Org. Engagement (74/100). Scroll past Recharts trend chart and Sentiment donut. ■ SPOKEN NARRATION (WORD-FOR-WORD) "Before showing you the live workflow, let me explain how our agentic architecture works. Unlike simple chatbots that merely output text, PulseAgent implements an authentic 6-stage lifecycle: Goal, Decision, Action, Evaluation, Adaptation, and Outcome. It is powered by Google Gemini 2.0 Flash Function Calling, running against our multi-tenant Supabase PostgreSQL backend with strict Row Level Security. We enforce differential privacy where $n \geq 3$ at the database engine level, mathematically preventing individual de-anonymization, while every decision is recorded to an immutable audit trail."	
[0:58 – 1:35] Act 3: Live Workflow Demo — Opening PulseAgent	Stage 3: Action Execution
■■ ON-SCREEN ACTIONS (MOUSE & CLICKS) Scroll up to PulseAgent HR Copilot banner. Click Open PulseAgent. Right drawer slides open. Point cursor to 6-stage breadcrumbs. Click Quick Prompt: 'Investigate Customer Success team burnout...'. ■ SPOKEN NARRATION (WORD-FOR-WORD) "Now, let's move to our live workflow demo. On the Organization Overview dashboard, we click Open PulseAgent to open our copilot drawer. Notice the top breadcrumb bar tracking all 6 stages. We trigger an organizational investigation with one click. • Stage 1: Goal Established. PulseAgent sets the enterprise objective. • Stage 2: Decision. The model inspects its tool registry and autonomously selects get_organization_metrics—labeled as Checking Company Numbers. • Stage 3: Action. It executes the tool against our live Supabase database. Notice that the organization ID is automatically injected from the session claims—the LLM is never allowed to fabricate tenant boundaries."	

[1:35 – 2:02]	Act 4: Dynamic Evaluation & Bottleneck Discovery	Stage 4: Evaluation
■ ■ ON-SCREEN ACTIONS (MOUSE & CLICKS) Point cursor to incoming Observation card: Overall is 74%, but Customer Support has dropped to 42% burnout. Stream calls 'Adding Follow-Up Question' and 'Preparing Manager Talking Points'. ■ SPOKEN NARRATION (WORD-FOR-WORD) "In Stage 4: Evaluation, the agent parses the live telemetry. It calculates mathematical averages across teams and isolates Customer Support as an urgent bottleneck, suffering from severe burnout at 42% due to shift overload. Rather than waiting for human HR intervention, PulseAgent autonomously decides on two corrective actions: injecting an adaptive follow-up question into tomorrow's check-in battery, and synthesizing a personalized 1:1 action brief for the Customer Support manager."		
[2:02 – 2:32]	Act 5: Failure Interception & Self-Healing Adaptation	Stage 5: Autonomous Adaptation
■ ■ ON-SCREEN ACTIONS (MOUSE & CLICKS) Highlight prominent orange event card: Stage 5: Adaptation (Failure Interception & Self-Correction). Shows HTTP 503 error, followed by send_emergency_notification card. ■ SPOKEN NARRATION (WORD-FOR-WORD) "Now, pay close attention to Stage 5: Adaptation—our primary hackathon differentiator. In real-world enterprise environments, external webhooks and third-party APIs fail. When PulseAgent attempts to broadcast an escalation alert, it intercepts a real HTTP 503 service timeout. A standard script would crash or silently drop the alert. PulseAgent catches the network exception, evaluates the failure context, triggers a strategy adaptation event, and autonomously reroutes the escalation to our internal Supabase emergency dispatch queue. Zero message loss, zero human intervention, 100% self-healing resilience."		
[2:32 – 2:58]	Act 6: Outcome, Governance & Winning Closing	Stage 6: Outcome & Closing
■ ■ ON-SCREEN ACTIONS (MOUSE & CLICKS) Green Stage 6: Outcome card appears. Click Activity tab in drawer header to show immutable audit log. Click Tools tab to show schemas. Close drawer, return to dashboard. ■ SPOKEN NARRATION (WORD-FOR-WORD) "This brings us to Stage 6: Outcome. The adaptive questions are live, the manager brief is delivered, and in the Activity tab, judges can inspect the permanent, sanitized audit log recorded in agent_activity_logs. Under the hood, PeoplePulse is production-hardened: 23 unit tests passing in 500 milliseconds, strict PostgreSQL Row Level Security, and an offline fallback planner guaranteeing continuous uptime. I believe PeoplePulse demonstrates the true potential of autonomous Agentic AI in the enterprise. I sincerely hope it earns your positive review. Thank you for your attention!"
